

JOIN :-

A join is used to combine rows from two or more tables based on a related column between them.

```
CREATE TABLE emp-1 (emp-id INT);
```

```
INSERT INTO emp-1 (emp-id) VALUES  
(1), (2), (3), (5), (7), (8);
```

```
SELECT * FROM emp-1;
```

```
CREATE TABLE emp-2 (emp-id INT);
```

```
INSERT INTO emp-2 (emp-id) VALUES  
(1), (2), (4), (6), (7), (8);
```

```
SELECT * FROM emp-2;
```

INNER JOIN :-

```
SELECT * FROM emp-1 AS e1
```

```
INNER JOIN
```

```
emp-2 AS e2
```

```
ON e1.emp-id = e2.emp-id;
```

③ LEFT JOIN %

SELECT * FROM emp-1 as e1
LEFT JOIN

emp-2 as e2
ON e1.emp-id = e2.emp-id

④ RIGHT JOIN %

SELECT * FROM emp-1 as e1
RIGHT JOIN

emp-2 as e2
ON e1.emp-id = e2.emp-id

⑤ FULL OUTER JOIN %

→ Left Join + Right Join

SELECT * FROM emp-1 as e1
Full outer join

emp-2 as e2
ON e1.emp-id = e2.emp-id
